**ABSTRACT**

The aim of this paper is to introduce pgrw-open map, pgrw\*-open map and to obtain some of their properties. In section 3 a pgrw-open map is defined and compared with other open maps. In section 4 compositions of two pgrw-open maps is considered. In section 5 pgrw\*-open map is defined and compared with pgrw-open map.

**Keywords:** pgrw-open set, pgrw-open map, pgrw\*-open map.

©KY PUBLICATIONS

**1. Introduction**

Different mathematicians worked on different versions of generalized open maps and related topological properties.  $\delta$ -open[23], gpr-open [10], gp-open[14] rw-open [3] mappings were introduced and studied by Raja Mohammad Latif, Gnanambal Y, T. Noiri, H. Maki and J. Umehara, Benchalli S.S. and Wali R.S. respectively.

**2. Preliminaries**

Throughout this paper,  $(X, \tau)$  and  $(Y, \sigma)$  (or simply  $X$  and  $Y$ ) represent the topological spaces. For a subset  $A$  of a space  $X$ ,  $cl(A)$  and  $int(A)$  denote the closure of  $A$  and the interior of  $A$  respectively.  $X \setminus A$  or  $A^c$  denotes the complement of  $A$  in  $X$ .

We recall the following definitions and results.

**Definition 2.1**

A subset  $A$  of a topological space  $(X, \tau)$  is called

1. a semi-open set[13] if  $A \subseteq cl(int(A))$  and a semi-closed set if  $int(cl(A)) \subseteq A$ .
2. a pre-open set[5] if  $A \subseteq int(cl(A))$  and a pre-closed set if  $cl(int(A)) \subseteq A$ .
3. an  $\alpha$ -open set [16] if  $A \subseteq int(cl(int(A)))$  and an  $\alpha$ -closed set if  $cl(int(cl(A))) \subseteq A$ .
4. a semi-pre open set [1,18]( $\beta$ -open)[10] if  $A \subseteq cl(int(cl(A)))$  and a semi-pre closed set = $\beta$ -closed)  $int(cl(int(A))) \subseteq A$ .
5. a regular open set [15] if  $A = int(clA)$  and a regular closed set if  $A = cl(int(A))$ .
6.  $\delta$ -closed [23] if  $A = cl \delta(A)$ , where  $cl \delta(A) = \{x \in X : int(cl(U)) \cap A \neq \Phi, U \in \tau \text{ and } x \in U\}$

7. a regular  $\alpha$ -open set (briefly,  $r\alpha$ -open)[28] if there is a regular open set  $U$  such that  $U \subset A \subset \alpha \text{cl}(U)$ .
8. a generalized closed set (briefly  $g$ -closed)[4] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .
9. a generalized pre regular closed set (briefly  $gpr$ -closed)[10] if  $\text{pcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular open in  $X$ .
10. a generalized semi-pre closed set (briefly  $gsp$ -closed)[9] if  $\text{spcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .
11. a  $w$ -closed set [26] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is semi-open in  $X$ .
12. a pre generalized pre regular closed set [2] (briefly  $pgpr$ -closed) if  $\text{pcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $rg$ -open in  $X$ .
13. a generalized semi pre regular closed (briefly  $gspr$ -closed) set [11] if  $\text{spcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular open in  $X$ .
14. a generalized pre closed (briefly  $gp$ -closed) set [20] if  $\text{pcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .
15. a  $\#$ regular generalized closed (briefly  $\#rg$ -closed) set [27] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $rw$ -open.
16. a  $g^*s$ -closed [22] set if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$ ,  $U$  is  $gs$  open.
17. a  $rw$ -closed [6] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular semi-open in  $X$ .
18.  $\alpha g$ -closed [16] if  $\alpha \text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open. In  $X$ .
19. a  $\omega\alpha$ -closed set [7] if  $\alpha \text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\omega$ -open in  $X$ .
20. an  $\alpha$ -regular  $w$  closed set (briefly  $\alpha rw$  -closed)[29] if  $\alpha \text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $rw$ -open in  $X$ .
21. a  $rg$ -closed set [19] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular-open in  $X$ .

The complements of the above mentioned closed sets are the respective open sets.

**Definition 2.2:** A map  $f : (X, \tau) \rightarrow (Y, \sigma)$  is said to be

1.  $\alpha$ -open [16] if  $f(F)$  is  $\alpha$ -open in  $Y$  for every open subset  $F$  of  $X$ .
2.  $\alpha g$ -open [16] if  $f(F)$  is  $\alpha g$ -open in  $Y$  for every open subset  $F$  of  $X$ .
3.  $\omega\alpha$ -open [7] if  $f(V)$  is  $\omega\alpha$ -open in  $Y$  for every open subset  $V$  of  $X$ .
4.  $\omega$ -open [26] if  $f(V)$  is  $\omega$ -open in  $Y$  for every closed subset  $V$  of  $X$ .
5.  $rw$ -open [6] if  $f(V)$  is  $rw$ -open in  $Y$  for every closed subset  $V$  of  $X$ .
6.  $g^*s$ -open [22] if for each open set  $F$  in  $X$ ,  $f(F)$  is a  $g^*s$ -open in  $Y$ .
7. Contra open [3] if  $f(F)$  is closed in  $Y$  for every open set  $F$  of  $X$ .
8. Contra regular-open [5] if  $f(F)$  is  $r$ -closed in  $Y$  for every open set  $F$  of  $X$ .
9. Contra semi-open [24] if  $f(F)$  is  $s$ -closed in  $Y$  for every open set  $F$  of  $X$ .
10. Semi pre-open [18] if  $f(V)$  is semi-pre-open in  $Y$  for every open subset  $V$  of  $X$ .
11.  $g$ -open [4,21] if  $f(V)$  is  $g$ -open in  $Y$  for every open subset  $V$  of  $X$ .
12.  $r\alpha$ -open [28] if  $f(V)$  is  $r\alpha$ -open in  $Y$  for every open subset  $V$  of  $X$ .
13.  $gpr$ -open [10] if  $f(U)$  is  $gpr$ -open in  $(Y, \sigma)$  for every open set  $U$  of  $(X, \tau)$ .
13. regular open [15] if  $f(U)$  is open in  $(Y, \sigma)$  for every regular open set  $U$  of  $(X, \tau)$ .
14. pre-open [17,24] if  $f(V)$  is pre-open in  $Y$  for every open set  $V$  of  $X$ .
15.  $gp$ -open [20] if the image of each open sets of  $X$  is  $gp$ -open in  $Y$ .
17.  $gspr$ -open [11] if  $f(V)$  is  $gspr$ -open in  $Y$  for every open subset  $V$  of  $X$ .
18.  $\alpha r\omega$ -open [29] if the image of every open set in  $(X, \tau)$  is  $\alpha r\omega$ -open in  $(Y, \sigma)$ .
19.  $\delta$ -open [23] if for every open set  $G$  in  $X$ ,  $f(G)$  is a  $\delta$ -open set in  $Y$ .
20.  $\#rg$ -open [27] if  $f(F)$  is  $\#rg$ -open in  $(Y, \sigma)$  for every  $\#rg$ -open set  $F$  of  $(X, \tau)$ .
21.  $gsp$ -open [9] if  $f(V)$  is  $gsp$ -open in  $(Y, \sigma)$  for every open set  $V$  of  $(X, \tau)$ .

The following results are from [31]

**Theorem:** Every  $pgpr$ -open set is  $pgrw$ -open.

**Theorem:** If  $A$  is regular closed and pgrw-open, then  $A$  is pre-open.

**Theorem:** If  $A$  is closed and gp-open, then  $A$  is pgrw-open.

**Theorem:** If  $A$  is both closed and g-open, then  $A$  is pgrw-open.

**Theorem:** If  $A$  is regular- closed and gpr-open, then it is pgrw-open.

**Theorem :** If  $A$  is both semi- closed and w-open, then it is pgrw-open.

**Theorem:** If  $A$  is closed and  $\alpha$ g-open, then it is pgrw-open.

The following results are from [31]

**Theorem:** For any topological space  $X$ ,

i. Every open ( $\alpha$ -open, regular-open,  $\alpha$ rw-open, #rg-open, pgpr-open ) set is pgrw-open.

ii. Every pgrw-open set is gp-open (gspr-open, gsp-open and gpr-open) .

**Definition 2.3: pgrw-irresolute map**[32]: A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a pre generalized regular weakly irresolute (pgrw-irresolute) map if  $f^{-1}(V)$  is a pgrw-closed set in  $X$  for every pgrw-closed set  $V$  in  $Y$ .

**Definition 2.3: pgrw-closed map**[30,31]: A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a pgrw-closed map if for every closed set  $A$  in  $(X, \tau)$  the image  $f(A)$  is a pgrw-closed set in  $(Y, \sigma)$ .

### 3. pgrw-open maps:

**Definition 3.1:** A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a pgrw-open map if for every open set  $A$  in  $(X, \tau)$  the image  $f(A)$  is a pgrw-open set in  $(Y, \sigma)$ .

**Example 3.2** :  $X = \{a, b, c, d\}$ ,  $\tau = \{X, \varphi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$ .

$Y = \{a, b, c\}$ ,  $\sigma = \{Y, \varphi, \{a\}, \{b\}, \{a, b\}\}$ . pgrw-open sets in  $Y$  are  $Y, \varphi, \{a\}, \{b\}, \{a, b\}$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=b, f(b)=a, f(c)=c, f(d)=a$ . Then  $f$  is a pgrw-open map.

**Theorem 3.3:** Every open map is a pgrw-open map.

**Proof:**  $f: (X, \tau) \rightarrow (Y, \sigma)$  is an open map.

$\Rightarrow \forall$  open set  $A$  of  $X$   $f(A)$  is open in  $Y$ .

$\Rightarrow \forall$  open set  $A$  of  $X$   $f(A)$  is pgrw-open in  $Y$ .

$\Rightarrow f: (X, \tau) \rightarrow (Y, \sigma)$  is a pgrw- open map.

The converse is not true.

**Example 3.4:**  $X = \{a, b, c\}$ ,  $\tau = \{X, \varphi, \{a\}, \{b, c\}\}$  and  $Y = \{a, b, c, d\}$ ,  $\sigma = \{Y, \varphi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$ . pgrw-open sets in  $Y$  are  $Y, \varphi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{a, c\}, \{b, c\}, \{a, d\}, \{a, b, c\}, \{a, b, d\}$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=c, f(b)=a, f(c)=a$ .  $f$  is a pgrw-open map, but not an open map.

**Theorem 3.5:** Every pre-open (regular-open,  $\alpha$ -open,  $\delta$ -open, #rg- open, pgpr-open,  $\alpha$ rw-open) map is pgrw-open.

**Proof:**  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a pre-open map.

$\Rightarrow \forall$  open set  $A$  in  $X$   $f(A)$  is pre- open in  $Y$ .

$\Rightarrow \forall$  open set  $A$  in  $X$   $f(A)$  is pgrw- open in  $Y$ .

$\Rightarrow f$  is a pgrw-open map.

Similarly remaining statements may be proved.

The converse is not true.

**Example 3.6:**  $X = \{a, b, c\}$ ,  $\tau = \{X, \varphi, \{a\}, \{b\}, \{a, b\}\}$ .

$Y = \{a, b, c, d\}$ ,  $\sigma = \{Y, \varphi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$ .

pgrw-open sets in  $Y$  are  $Y, \varphi, \{a, b, d\}, \{a, b, c\}, \{a, d\}, \{a, b\}, \{b, c\}, \{a, c\}, \{a\}, \{b\}, \{c\}$ .

pre-open sets in  $Y$  are  $Y, \varphi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}, \{a, b, d\}$ .

Regular open sets in  $Y$  are  $Y, \varphi, \{a\}, \{b\}$ .

$\delta$ -open sets in  $Y$  are  $Y, \varphi, \{a\}, \{b\}, \{a, b\}$ .

$\alpha$ -open sets in  $Y$  are  $Y, \varphi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}, \{a, b, d\}$ .

pgpr-open sets in  $Y$  are  $Y, \emptyset, \{a\}, \{b\}, \{b,c\}, \{a,b,c\}, \{a,b,d\}$ . #rg-open sets in  $Y$  are  $Y, \emptyset, \{a\}, \{b\}, \{a,b\}, \{b,c\}, \{a,c\}, \{b,d\}, \{a,b,c\}$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=b, f(b)=c, f(c)=d$ .  $f$  is pgrw-open.  $f\{a,b\} = \{b,c\}$  is neither pre-open nor regular open nor  $\delta$ -open nor  $\alpha$ -open and  $f(\{b\}) = \{c\}$  is neither pgpr-open nor #rg-open. So  $f$  is neither pre-open nor regular-open nor  $\alpha$ -open nor  $\delta$ -open nor #rg-open nor pgpr-open.

**Example 3.7:**  $X = \{a,b,c\}, \tau = \{X, \emptyset, \{a\}, \{a,c\}\}, Y = \{a,b,c,d\}, \sigma = \{Y, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,b,c\}\}$ . pgrw-open sets in  $Y$  are  $Y, \emptyset, \{a,b,d\}, \{a,b,c\}, \{a,d\}, \{a,b\}, \{b,c\}, \{a,c\}, \{a\}, \{b\}, \{c\}$ .  $\alpha$ rw-open sets in  $Y$  are  $Y, \emptyset, \{a\}, \{b\}, \{c\}$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=a, f(b)=c, f(c)=d$ .  $f$  is pgrw-open, but not  $\alpha$ rw-open.

**Theorem 3.8:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a contra-r-open and pgrw-open map, then  $f$  is pre-open.

**Proof:**  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a contra-r-open and pgrw-open map.

$\Rightarrow \forall$  open set  $A$  in  $X$   $f(A)$  is regular closed and pgrw-open in  $Y$ .

$\Rightarrow \forall$  open set  $A$  in  $X$   $f(A)$  is pre-open in  $Y$ .

$\Rightarrow f$  is a pre-open map.

**Theorem 3.9:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a pgrw-open map, then  $f$  is a gp-open (gsp-open, gspr-open, gpr-open) map.

**Proof:**  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a pgrw-open map.

$\Rightarrow \forall$  open set  $A$  in  $X$   $f(A)$  is a pgrw-open set in  $Y$ .

$\Rightarrow \forall$  open set  $A$  in  $X$   $f(A)$  is a gp-open set in  $Y$ .

$\Rightarrow f$  is a gp-open map.

Similarly the other results follow.

The converse is not true.

**Example 3.10:**  $X = \{a,b,c\}, \tau = \{X, \emptyset, \{a\}, \{b,c\}\}, Y = \{a,b,c\}, \sigma = \{Y, \emptyset, \{a\}\}$ .

pgrw-open sets in  $Y$  are  $Y, \emptyset, \{a,c\}, \{a,b\}, \{a\}$ . gp-open sets in  $Y$  are  $Y, \emptyset, \{a,c\}, \{a,b\}, \{c\}, \{a\}, \{b\}$ . gpr-open sets in  $Y$  are all subsets of  $Y$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f: X \rightarrow Y$  as  $f(a)=b, f(b)=a, f(c)=c$ .  $f$  is gp-open and gpr-open but,  $f$  is not pgrw-open because  $f(\{a\}) = \{b\}$  is not pgrw-open.

**Example 3.11:**  $X = \{a,b,c,d\}, \tau = \{X, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,b,c\}\}$ .

$Y = \{a,b,c\}, \sigma = \{Y, \emptyset, \{a\}, \{b\}, \{a,b\}\}$ . pgrw-open sets in  $Y$  are  $Y, \emptyset, \{a,b\}, \{b\}, \{a\}$ . gsp-open sets in  $Y$  are all subsets of  $Y$ . gspr-open sets in  $Y$  are all subsets of  $Y$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=c, f(b)=a, f(c)=b, f(d)=c$ .  $f$  is a gsp-open and gspr-open map, but  $f$  is not a pgrw-open map.

**Theorem 3.12:** If a map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is pgrw-open and  $A$  is an open set of  $X$ , then

$f_A: (A, \tau_A) \rightarrow (Y, \sigma)$  is pgrw-open.

**Proof:**  $A$  is an open set of  $X$ . Let  $F$  be an open set of  $(A, \tau_A)$ . Then  $F = A \cap E$  for some open set  $E$  of  $(X, \tau)$  and so  $F$  is an open set of  $(X, \tau)$ . Since  $f$  is a pgrw-open map,  $f(F)$  is pgrw-open set in  $(Y, \sigma)$ . But for every  $F$  in  $A$ ,  $f_A(F) = f(F)$  and  $\therefore f_A: (A, \tau_A) \rightarrow (Y, \sigma)$  is pgrw-open.

**Theorem 3.13:** For any bijective map  $f: (X, \tau) \rightarrow (Y, \sigma)$ , the following statements are equivalent:

i)  $f^{-1}: (Y, \sigma) \rightarrow (X, \tau)$  is pgrw-continuous.

ii)  $f$  is pgrw-closed.

iii)  $f$  is pgrw-open.

**Proof:** (i)  $\Rightarrow$  (ii):  $f: (X, \tau) \rightarrow (Y, \sigma)$  is bijective.  $\Rightarrow f^{-1}: (Y, \sigma) \rightarrow (X, \tau)$  exists and  $(f^{-1})^{-1} = f$

and so  $f$  is bijective and  $f^{-1}$  is pgrw-continuous.

$\Rightarrow (f^{-1})^{-1} = f$  and  $\forall$  closed set  $F$  in  $X, (f^{-1})^{-1}(F)$  is pgrw-closed in  $Y$ .

$\Rightarrow \forall$  closed set  $F$  in  $X, f(F)$  is pgrw-closed in  $Y$ .

$\Rightarrow f$  is a pgrw-closed map.

(ii)  $\Rightarrow$  (iii):  $U$  is an open set in  $X, f: (X, \tau) \rightarrow (Y, \sigma)$  is a pgrw-closed map and  $f$  is bijective.

$\Rightarrow f(U^c)$  is pgrw-closed in  $Y$  and  $f(U^c) = (f(U))^c$ .

$\Rightarrow (f(U))^c$  is pgrw-closed in  $Y$ .

$\Rightarrow f(U)$  is pgrw-open in  $Y$ . Hence  $f$  is a pgrw-open map.

iii)  $\Rightarrow$ (i): A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is bijective and pgrw-open.

$\Rightarrow$  inverse map  $f^{-1}$  exists,  $(f^{-1})^{-1} = f$  and  $\forall$  open set  $U$  in  $X$ ,  $f(U)$  is pgrw-open.

$\Rightarrow \forall$  open set  $U$  in  $X$ ,  $(f^{-1})^{-1}(U)$  is pgrw-open in  $Y$ .

$\Rightarrow f^{-1}: (Y, \sigma) \rightarrow (X, \tau)$  is a pgrw-continuous map.

**Theorem 3.14:** A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is pgrw-open if and only if for any subset  $S$  of

$(Y, \sigma)$  and for any closed set  $F$  containing  $f^{-1}(S)$  in  $X$ ,  $\exists$  a pgrw-closed set  $K$  in  $Y$  such that  $S \subseteq K$  and  $f^{-1}(K) \subseteq F$ .

**Proof:** i)  $f: X \rightarrow Y$  is a map,  $S \subseteq Y$  and  $f^{-1}(S) \subseteq F$ , a subset of  $X$ .

$\Rightarrow S \cap f(X-F) = \emptyset \Rightarrow S \subseteq Y - f(X-F)$ .

ii)  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a pgrw-open map and  $F$  is a closed set in  $X$ .

$\Rightarrow f(X-F)$  is a pgrw-open set in  $Y$ .  $\Rightarrow Y - f(X-F) = K$  (say) is a pgrw-closed set in  $Y$ .

$\Rightarrow f^{-1}(K) = X - f^{-1}(f(X-F)) \subseteq X - (X-F) = F$ . From (i) and (ii) if  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a pgrw-open map, then  $\forall S \subseteq Y$  and  $\forall$  closed set  $F$  containing  $f^{-1}(S)$  in  $X$ ,  $\exists$  a pgrw-closed set  $K = Y - f(X-F)$  such that  $S \subseteq K$  and  $f^{-1}(K) \subseteq F$ .

Conversely

Suppose that  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a map such that  $\forall S \subseteq Y$  and for every closed set  $F$  containing  $f^{-1}(S)$  in  $X$ ,  $\exists$  a pgrw-closed set  $K$  in  $Y$  such that  $S \subseteq K$  and  $f^{-1}(K) \subseteq F$ .

$\forall U \subseteq X$ ,  $f^{-1}((f(U))^c) \subseteq U^c$ . If  $U$  is an open subset of  $X$ , then  $U^c$  is closed in  $X$ . Take  $S = (f(U))^c$  and  $F = U^c$ .

Then by the hypothesis  $\exists$  a pgrw-closed set  $K$  in  $Y$  such that  $(f(U))^c \subseteq K$  and

$f^{-1}(K) \subseteq U^c$ .  $\Rightarrow K^c \subseteq f(U)$  and  $U \subseteq (f^{-1}(K))^c \Rightarrow K^c \subseteq f(U)$  and  $f(U) \subseteq f((f^{-1}(K))^c) \subseteq K^c$ .

$\Rightarrow K^c \subseteq f(U) \subseteq K^c \Rightarrow K^c = f(U)$ . As  $K$  is pgrw-closed,  $K^c$  is pgrw-open. Thus  $\forall$  open set  $U$  in  $X$ ,  $f(U)$  is pgrw-open in  $Y$ . Hence  $f$  is a pgrw-open map.

**Theorem 3.15:** If a map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is pgrw-open, then  $f^{-1}(\text{pgrw-cl}(B)) \subseteq \text{cl}(f^{-1}(B)) \forall$  subset  $B$  of  $(Y, \sigma)$ .

**Proof:** For any map  $f: X \rightarrow Y$  and for any subset  $B$  of  $Y$ ,  $f^{-1}(B) \subseteq \text{cl}(f^{-1}(B))$  and  $\text{cl}(f^{-1}(B))$  is closed in  $X$ . So  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a pgrw-open map,  $B$  is any subset of  $Y$  and  $\text{cl}(f^{-1}(B))$  is a closed set containing  $f^{-1}(B)$  in  $X$ .  $\Rightarrow \exists$  a pgrw-closed set  $K$  of  $Y$  such that  $B \subseteq K$  and

$f^{-1}(K) \subseteq \text{cl}(f^{-1}(B))$ .  $\Rightarrow \text{pgrw-cl}(B) \subseteq \text{pgrw-cl}(K) = K$  and  $f^{-1}(K) \subseteq \text{cl}(f^{-1}(B))$ .

$\Rightarrow f^{-1}(\text{pgrw-cl}(B)) \subseteq \text{cl}(f^{-1}(B))$ .

**Theorem 3.16:** If a map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is pgrw-open, then  $f(\text{int}(A)) \subseteq \text{pgrw-int}(f(A))$  for every subset  $A$  of  $(X, \tau)$ .

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a pgrw-open map and  $A$  be any subset of  $(X, \tau)$ . Then  $\text{int}(A)$  is open in  $(X, \tau)$  and so  $f(\text{int}(A))$  is pgrw-open in  $(Y, \sigma)$ . As  $\text{int}(A) \subseteq A$ ,  $f(\text{int}(A)) \subseteq f(A)$ .  $\therefore$  by Theorem in [32],  $f(\text{int}(A)) \subseteq \text{pgrw-int}(f(A))$ .

**Theorem 3.17:** If a map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is pgrw-open, then for each neighbourhood  $U$  of  $x$  in  $(X, \tau)$ , there exists a pgrw-neighbourhood [32]  $W$  of  $f(x)$  in  $Y$  such that  $W \subseteq f(U)$ .

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a pgrw-open map. Let  $x \in X$  and  $U$  be a neighbourhood of  $x$  in  $(X, \tau)$ . Then  $\exists$  an open set  $G$  in  $(X, \tau)$  such that  $x \in G \subseteq U$ . Now  $f(x) \in f(G) \subseteq f(U)$  and  $f(G)$  is a pgrw-open set in  $(Y, \sigma)$ , because  $f$  is a pgrw-open map. By Theorem 6.7 in [33],  $f(G)$  is a pgrw-neighbourhood of each of its points. Taking  $f(G) = W$ ,  $W$  is a pgrw-neighbourhood of  $f(x)$  in  $(Y, \sigma)$  such that  $W \subseteq f(U)$ .

**Theorem 3.18:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a contra open and gp-open map, then  $f$  is pgrw-open.

**Proof:**  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a contra open and gp-open map.

$\Rightarrow \forall$  open set  $V$  in  $X$   $f(V)$  is a closed and  $g$ -open set in  $Y$  .

$\Rightarrow \forall$  open set  $V$  in  $X$   $f(V)$  is  $g$ -open in  $Y$ .

$\Rightarrow f$  is a  $g$ -open map.

**Theorem 3.19:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a contra-open and  $g$ -open map, then  $f$  is  $g$ -open.

**Proof:**  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a contra-open and  $g$ -open map.

$\Rightarrow \forall$  open set  $V$  in  $X$   $f(V)$  is a closed and  $g$ -open set in  $Y$  .

$\Rightarrow \forall$  open set  $V$  in  $X$   $f(V)$  is  $g$ -open in  $Y$ .

$\Rightarrow f$  is a  $g$ -open map.

**Theorem 3.20:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a contra regular-open and  $g$ -open map, then  $f$  is a  $g$ -open map.

**Proof:**  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a contra regular-open and  $g$ -open map.

$\Rightarrow \forall$  open set  $V$  in  $X$   $f(V)$  is a regular-closed and  $g$ -open set in  $Y$  .

$\Rightarrow \forall$  open set  $V$  in  $X$   $f(V)$  is  $g$ -open in  $Y$ .

$\Rightarrow f$  is a  $g$ -open map.

**Theorem 3.21:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a contra semi-open and  $w$ -open map, then  $f$  is a  $g$ -open map.

**Proof:**  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a contra semi-open and  $w$ -open map.

$\Rightarrow \forall$  open set  $V$  in  $X$   $f(V)$  is a semi-closed and  $w$ -open set in  $Y$  .

$\Rightarrow \forall$  open set  $V$  in  $X$   $f(V)$  is  $g$ -open in  $Y$ .

$\Rightarrow f$  is a  $g$ -open map.

**Theorem 3.22:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a contra open and  $g$ -open map, then  $f$  is  $g$ -open.

**Proof:**  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a contra open and  $g$ -open map.

$\Rightarrow \forall$  open set  $V$  in  $X$   $f(V)$  is a closed and  $g$ -open set in  $Y$  .

$\Rightarrow \forall$  open set  $V$  in  $X$   $f(V)$  is  $g$ -open in  $Y$ .

$\Rightarrow f$  is a  $g$ -open map.

The following examples illustrate that the  $g$ -open map and  $w$ -open map ( $g^*$ -open map,  $\alpha$ -open map and  $w\alpha$ -open map,  $\beta$ -open map, semi-open map) are independent.

**Example 3.23:** To show that  $g$ -open map and  $w$ -open map are independent.

i)  $X = \{a, b, c\}$ ,  $\tau = \{X, \emptyset, \{a\}, \{a, c\}\}$ .  $Y = \{a, b, c, d\}$ ,  $\sigma = \{Y, \emptyset, \{a, b\}, \{c, d\}\}$ .

$g$ -open sets in  $Y$  are all subsets of  $Y$ .  $w$ -open sets in  $Y$  are  $Y, \emptyset, \{a, b\}, \{c, d\}$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=b, f(b)=c, f(c)=a$ .  $f$  is  $g$ -open, but  $f$  is not  $w$ -open.

ii)  $X = \{a, b, c\}, \tau = \{X, \emptyset, \{a\}\}, Y = \{a, b, c\}, \sigma = \{Y, \emptyset, \{a\}, \{b\}, \{a, b\}\}$ .

$g$ -open sets in  $Y$  are  $Y, \emptyset, \{a, b\}, \{a\}, \{b\}$ .  $w$ -open sets in  $Y$  are  $Y, \emptyset, \{a\}, \{b\}, \{c\}, \{a, b\}$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a)=c, f(b)=a, f(c)=b$ .  $f$  is not  $g$ -open, but  $f$  is  $w$ -open.

**Example 3.24:** To show that  $g$ -open map and  $g^*$ -open map are independent.

i)  $X = \{a, b, c, d\}, \tau = \{X, \emptyset, \{a\}, \{a, c\}\}$ .  $Y = \{a, b, c\}, \sigma = \{Y, \emptyset, \{a\}, \{b, c\}\}$ .

$g$ -open sets in  $Y$  are all subsets of  $Y$ .  $g^*$ -open sets in  $Y$  are  $Y, \emptyset, \{a\}, \{b, c\}$ . A map

$f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=c, f(b)=a, f(c)=b, f(d)=b$ .  $f$  is  $g$ -open, but  $f$  is not  $g^*$ -open.

ii)  $X = \{a, b, c, d\}, \tau = \{X, \emptyset, \{b, c\}, \{b, c, d\}, \{a, b, c\}\}$ .  $Y = \{a, b, c, d\}, \sigma = \{Y, \emptyset, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$ .  $g$ -open sets in  $Y$  are  $Y, \emptyset, \{a, b, d\}, \{a, b, c\}, \{a, d\}, \{a, b\}, \{b, c\}, \{a, c\}, \{a\}, \{b\}, \{c\}$ .  $g^*$ -open sets in  $Y$  are  $Y, \emptyset, \{b, c, d\}, \{a, c, d\}, \{a, b, d\}, \{a, b, c\}, \{a, d\}, \{a, b\}, \{b, c\}, \{b, d\}, \{a\}, \{b\}$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=c, f(b)=d, f(c)=b, f(d)=a$ .  $f$  is not  $g$ -open, but  $f$  is  $g^*$ -open.

**Example 3.25:** To show that  $g$ -open map and  $\alpha$ -open map are independent.

i)  $X = \{a, b, c\}, \tau = \{X, \emptyset, \{a\}, \{a, c\}\}$  and  $Y = \{a, b, c\}, \sigma = \{Y, \emptyset, \{a\}, \{b, c\}\}$ .  $g$ -open sets in  $Y$  are all subsets of  $Y$ .  $\alpha$ -open sets in  $Y$  are  $Y, \emptyset, \{a\}, \{b, c\}$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=c, f(b)=a, f(c)=b$ .  $f$  is a  $g$ -open map, but  $f$  is not  $\alpha$ -open.

ii)  $X=\{a,b,c,d\}$ ,  $\tau=\{X, \varphi, \{a\}, \{c,d\}, \{a,c,d\}\}$ .  $Y=\{a,b,c,d\}$ ,  $\sigma=\{Y, \varphi, \{a\}, \{b\}, \{a,b\}, \{a,b,c\}\}$ . Pgrw-open sets in  $Y$  are  $Y, \varphi, \{a,b,d\}, \{a,b,c\}, \{a,d\}, \{a,b\}, \{b,c\}, \{a,c\}, \{a\}, \{b\}, \{c\}$ .

$\alpha$ -open sets in  $Y$  are  $Y, \varphi, \{b,c,d\}, \{a,c,d\}, \{a\}, \{b\}, \{b,c\}, \{a,c\}, \{b,d\}, \{a,d\}$ .

A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=d, f(b)=a, f(c)=c, f(d)=d$ .  $f$  is not a pgrw-open map, but  $f$  is  $\alpha$ -open.

**Example 3.26:** To show that pgrw- open map and  $w\alpha$ - open map are independent.

i)  $X=\{a,b,c,d\}$ ,  $\tau=\{X, \varphi, \{a,b\}, \{c,d\}\}$ .  $Y=\{a,b,c,d\}$ ,  $\sigma=\{Y, \varphi, \{b,c\}, \{b,c,d\}, \{a,b,c\}\}$

Pgrw-open sets in  $Y$  are  $Y, \varphi, \{b,c,d\}, \{a,c,d\}, \{a,b,d\}, \{a,b,c\}, \{c,d\}, \{b,d\}, \{a,b\}, \{b,c\}, \{a,c\}, \{b\}, \{c\}$ .

$w\alpha$ -open sets in  $Y$  are  $Y, \varphi, \{b,c,d\}, \{a,b,c\}, \{b,c\}, \{b\}, \{c\}$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=c, f(b)=d, f(c)=a, f(d)=b$ .  $f$  is pgrw-open, but  $f$  is not  $w\alpha$ -open.

ii)  $X=\{a,b,c\}$ ,  $\tau=\{X, \varphi, \{a\}, \{b\}, \{a,b\}\}$ .  $Y=\{a,b,c,d\}$   $\sigma=\{Y, \varphi, \{a\}, \{b\}, \{a,b\}, \{a,b,c\}\}$

Pgrw-open sets in  $Y$  are  $Y, \varphi, \{a,b,d\}, \{a,b,c\}, \{a,d\}, \{a,b\}, \{b,c\}, \{a,c\}, \{a\}, \{b\}, \{c\}$ .

$w\alpha$ -open sets in  $Y$  are  $Y, \varphi, \{b,c,d\}, \{a,c,d\}, \{a,b,d\}, \{c,d\}, \{a,d\}, \{b,d\}, \{d\}, \{c\}$ .

A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=d, f(b)=c, f(c)=b$ .  $f$  is not pgrw-open, but it is  $w\alpha$ -open.

**Example 3.27:** To show that pgrw-open map and  $\beta$ -open map are independent.

i)  $X=\{a,b,c,d\}$ ,  $\tau=\{X, \varphi, \{a\}, \{b\}, \{a,b\}, \{a,b,c\}\}$  and

$Y=\{a,b,c,d\}$ ,  $\sigma=\{Y, \varphi, \{a\}, \{b\}, \{a,b\}, \{a,b,c\}\}$  pgrw-open sets in  $Y$  are  $Y, \varphi, \{a,b,d\}, \{a,b,c\}, \{a,d\}, \{a,b\},$

$\{b,c\}, \{a,c\}, \{a\}, \{b\}, \{c\}$ .  $\beta$ -open sets in  $Y$  are  $Y, \varphi, \{b,c,d\}, \{a,c,d\}, \{a,b,d\}, \{a,b,c\}, \{a,d\}, \{b,d\}, \{a,c\}, \{a,b\}, \{b,c\}, \{a\}, \{b\}$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=c, f(b)=b, f(c)=a, f(d)=d$ .  $f$  is pgrw-open map, but not  $\beta$ -open.

ii) A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=b, f(b)=b, f(c)=d, f(d)=c$  in the above example.  $f$  is  $\beta$ -open, but not pgrw-open.

**Example 3.28:** To show that pgrw-open map and semi-open map are independent.

i)  $X=\{a,b,c\}$ ,  $\tau=\{X, \varphi, \{a\}\}$  and  $Y=\{a,b,c,d\}$ ,  $\sigma=\{Y, \varphi, \{a\}, \{b\}, \{a,b\}, \{a,b,c\}\}$

Pgrw-open sets in  $Y$  are  $Y, \varphi, \{a,b,d\}, \{a,b,c\}, \{a,d\}, \{a,b\}, \{b,c\}, \{a,c\}, \{a\}, \{b\}, \{c\}$ .

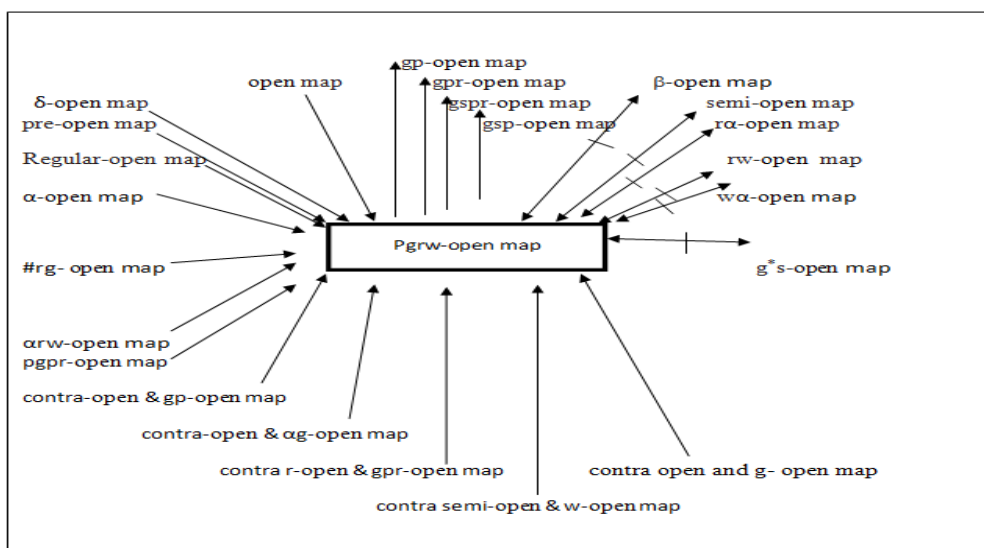

Semi-open sets in  $Y$  are  $Y, \varphi, \{b,c,d\}, \{a,c,d\}, \{a,b,d\}, \{a,b,c\}, \{a,c\}, \{b,c\}, \{a,d\}, \{a,b\}, \{b,c\}, \{a\}, \{b\}$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=c, f(b)=a, f(c)=b$ .  $f$  is pgrw-open, but  $f$  is not semi-open.

ii) A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=b, f(b)=c, f(c)=d$  in the above example.  $f$  is semi-open, but not pgrw-open.

In the diagram,

A  $\longrightarrow$  B means 'If A, then B.'

A  $\longleftrightarrow$  B means 'A and B are independent.'

#### 4. Composition of maps:

**Remark 4.1:**The composition of two pgrw-open maps need not be a pgrw-open map.

**Example 4.2:** $X=\{a,b,c\}, \tau =\{X,\varphi,\{a\},\{a,b\}\}$ .  $Y=\{a,b,c\}, \sigma=\{Y, \varphi, \{a\}\}$ . pgrw-open sets in  $Y$  are  $Y,\varphi, \{a,c\},\{a,b\},\{a\}$ .  $Z=\{a,b,c\}, \eta =\{Z,\varphi,\{a\},\{c\},\{a,c\}\}$ . pgrw-open sets in  $Z$  are  $Z,\varphi,\{a,c\},\{c\},\{a\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y,\sigma) \rightarrow (Z, \eta)$  be the identity maps. Then  $f$  and  $g$  are pgrw-open maps. The composition  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is not a pgrw-open map, because  $\{a,b\}$  is open in  $X$  and  $g \circ f(\{a,b\}) = \{a,b\}$  is not pgrw-open in  $Z$ .

**Theorem 4.3:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is an open map and  $g: (Y,\sigma) \rightarrow (Z, \eta)$  is a pgrw-open map, then the composition  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is a pgrw-open map.

**Proof:**  $f: (X, \tau) \rightarrow (Y, \sigma)$  is an open map and  $g: (Y,\sigma) \rightarrow (Z, \eta)$  is a pgrw-open map.

$\Rightarrow \forall$  open set  $F$  in  $X$   $f(F)$  is an open set in  $(Y, \sigma)$  and  $g(f(F))$  is a pgrw-open set in  $(Z, \eta)$ .

$\Rightarrow \forall$  open set  $F$  in  $X$   $g \circ f(F) = g(f(F))$  is a pgrw-open set in  $(Z, \eta)$ .

$\Rightarrow g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is a pgrw-open map.

**Remark 4.4:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a pgrw-open map and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is an open map, then the composition  $g \circ f$  need not be a pgrw-open map.

**Example 4.5:** $X=\{a,b,c\}, \tau =\{X,\varphi,\{a\},\{b\},\{a,b\}\}$ ,  $Y=\{a,b,c\}, \sigma=\{Y, \varphi, \{a\},\{b,c\}\}$ ,  $Z=\{a,b,c\}, \eta =\{Z,\varphi, \{b\},\{c\},\{b,c\}\}$ . pgrw-open sets in  $Y$  are all subsets of  $Y$ . pgrw-open sets in  $Z$  are  $Z, \varphi, \{b,c\},\{c\},\{b\}$ . Let  $f: X \rightarrow Y$  be the identity map. Then  $f$  is a pgrw-open map. A map  $g: Y \rightarrow Z$  is defined by  $g(a)=a, g(b)=a, g(c)=b$ , then  $g$  is open.  $\{a\}$  is open in  $X$  and  $(g \circ f)(\{a\}) = \{a\}$  is not pgrw-open in  $Z$ .  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is not a pgrw-open map.

#### 5. pgrw\*-open map:

**Definition 5.1:** A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be a pgrw\*-open map if for every pgrw-open set  $A$  in  $(X, \tau)$  the image  $f(A)$  is a pgrw-open set in  $(Y, \sigma)$ .

**Example 5.2:**  $X=\{a,b,c\}, \tau =\{X, \varphi, \{a\}, \{a,c\}\}$ . pgrw-open sets in  $X$  are  $X, \varphi, \{a,c\}, \{a,b\},\{a\}$ .  $Y=\{a,b,c\}, \sigma =\{Y, \varphi, \{a\}, \{b,c\}\}$ . pgrw-open sets in  $Y$  are  $Y, \varphi, \{b,c\},\{a,c\},\{a,b\}, \{a\},\{b\},\{c\}$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=b, f(b)=c, f(c)=a$ .  $f$  is a pgrw\*-open map.

**Theorem 5.3:** Every pgrw\*-open map is a pgrw-open map.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a pgrw\*-open map. Let  $A$  be an open set in  $X$ . Then  $A$  is pgrw-open. As  $f$  is a pgrw\*-open map,  $f(A)$  is pgrw-open in  $Y$ . Hence  $f$  is a pgrw-open map.

The converse is not true.

**Example 5.4:**  $X=\{a,b,c\}, \tau =\{X, \varphi, \{a\}, \{b,c\}\}$ . pgrw-open sets in  $X$  are  $X, \varphi, \{b,c\}, \{a,c\}, \{a,b\},\{a\},\{b\},\{c\}$ .  $Y=\{a,b,c\}, \sigma =\{Y, \varphi, \{a\}, \{a,c\}\}$ . pgrw-open sets in  $Y$  are  $Y, \varphi, \{a,c\}, \{a,b\}, \{a\}$ . A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is defined by  $f(a)=a, f(b)=a, f(c)=c$ .  $f$  is a pgrw-open map, but not pgrw\*-open.

**Theorem 5.5:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a pgrw-open map and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is a pgrw\*-open map, then the composition  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is pgrw-open.

**Proof:** $f: (X, \tau) \rightarrow (Y, \sigma)$  is a pgrw-open map and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is a pgrw\*-open map.

$\Rightarrow \forall$  open set  $A$  in  $X$ ,  $f(A)$  is pgrw-open in  $Y$  and  $g(f(A))$  is pgrw-open in  $Z$ .

$\Rightarrow \forall$  open set  $A$  in  $X$ ,  $g \circ f(A)$  is pgrw-open in  $Z$ .

$\Rightarrow g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is a pgrw-open map.

**Theorem 5.6:**If  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  are pgrw\*-open maps, then the composition  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is also pgrw\*-open.

**Proof:**  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  are pgrw\*-open maps.

$\Rightarrow \forall$  pgrw-open set  $A$  in  $X$ ,  $f(A)$  is pgrw-open in  $Y$  and  $g(f(A))$  is pgrw-open in  $Z$ .

$\Rightarrow \forall$  pgrw-open set  $A$  in  $X$ ,  $g \circ f(A)$  is pgrw-open in  $Z$ .

$\Rightarrow g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is a pgrw\*-open map.

**Theorem 5.7:** For any bijective map  $f : (X, \tau) \rightarrow (Y, \sigma)$  the following statements are equivalent:

i)  $f^{-1} : (Y, \sigma) \rightarrow (X, \tau)$  is pgrw-irresolute.

ii)  $f$  is a pgrw\*-closed map.

iii)  $f$  is a pgrw\* -open map.

**Proof:** (i)  $\Rightarrow$  (ii):  $f : (X, \tau) \rightarrow (Y, \sigma)$  is a bijective map.  $\Rightarrow f^{-1}$  exists and  $(f^{-1})^{-1} = f$ .

Hence  $f$  is bijective and  $f^{-1} : (Y, \sigma) \rightarrow (X, \tau)$  is pgrw-irresolute.

$\Rightarrow (f^{-1})^{-1} = f$  and  $\forall$  pgrw-closed set  $U$  in  $X$ ,  $(f^{-1})^{-1}(U)$  is pgrw-closed in  $Y$ .

$\Rightarrow \forall$  pgrw-closed set  $U$  in  $X$ ,  $f(U)$  is pgrw-closed in  $Y$ .  $\Rightarrow f$  is pgrw\* -closed map.

(ii)  $\Rightarrow$  (iii):  $f : (X, \tau) \rightarrow (Y, \sigma)$  is a bijective and pgrw\*-closed map.

$\Rightarrow \forall$  set  $A$  in  $X$ ,  $f(A^c) = [f(A)]^c$  and  $\forall$  pgrw-open set  $U$  in  $X$ ,  $f(U^c)$  is pgrw-closed in  $Y$ .

$\Rightarrow \forall$  pgrw-open set  $U$  in  $X$ ,  $(f(U))^c$  is pgrw-closed in  $Y$ .  $\Rightarrow \forall$  pgrw-open set  $U$  in  $X$ ,  $f(U)$  is pgrw-open in  $Y$ .  $\Rightarrow f$  is a pgrw\*-open map.

(iii)  $\Rightarrow$  (i):  $f : (X, \tau) \rightarrow (Y, \sigma)$  is a bijective and pgrw\*-open map.

$\Rightarrow f^{-1} : (Y, \sigma) \rightarrow (X, \tau)$  exists and  $(f^{-1})^{-1} = f$  and  $\forall$  pgrw-open set  $U$  in  $X$ ,  $f(U)$  is pgrw-open in  $Y$ .

$\Rightarrow \forall$  pgrw-open set  $U$  in  $X$ ,  $((f^{-1})^{-1}(U))$  is pgrw-open in  $Y$ .

$\Rightarrow f^{-1} : (Y, \sigma) \rightarrow (X, \tau)$  is pgrw-irresolute.
